

# AGENTS AND CRYSTALS FOR IMPROVING EXCRETORY POTENCY OF URINARY BLADDER

This is a continuation-in-part of U.S. Serial No. 09/787,288, filed March 15, 2001.

## Background of the Invention

### 1. Field of the Invention

The present invention relates to drugs, particularly agents for further improving excretory potency of the urinary bladder. The present invention further relates to crystals and pharmaceutical compositions comprising the crystals of a tricyclic, condensed, heterocyclic compound which inhibit acetylcholinesterase and improve excretory potency of the urinary bladder.

### 2. Description of Related Art

Inferior uropathy is a general term for subjective or objective disorders in a process through accumulation of urine (urinary storage) till excretion (urination), which may be classified into urinary cumulative disorders (incontinence of urine, pollakiuria, etc.), dysuria (difficulty of urination, scalding, obstruction of urinary tract, etc.), and the like. Inferior uropathy in the aged, particularly dysuria, especially dysuria caused by prostatomegaly, becomes a great problem of public concern with the advance of a recent aging society, though inferior uropathy may also be found in the youth.

Urination is, under the control of the urination center, controlled by the peripheral nervous system involving a parasympathetic nerve such as the pelvic nerve, the sympathetic nerve such as the hypogastric nerve, and the somatic nerve such as the pudendal nerve, and it is suggested that a variety of neurotransmitters (e.g., acetylcholine, adrenaline, ATP, Substance P, neuropeptide Y, etc.) are involved in urination.

As agents for treatment of dysuria, particularly difficulty of urination, those for increasing contraction of the muscles of the urinary bladder (detrusor) or relaxing sphincter muscle of the urethra to reduce urethral resistance have been used. As the agents acting on the muscle of the urinary bladder to increase the contraction, for

example, cholinergic agents such as bethanechol, acetylcholinesterase inhibitors such as distigmine, and the like have been used. Bethanechol however is incompatible with pregnant women, peptic ulcers, organic ileus, asthma, hyperthyroidism, etc., because it has adverse effects such as epiphora, sweating, gastro-intestinal disorders, stomachache, etc. No entirely satisfactory drugs have yet been found.

As the acetylcholinesterase inhibitors increasing contraction of the muscle of the urinary bladder, carbamate- type acetylcholinesterase inhibitors having a carbamate structure (-OCON-) in its molecule (e.g., distigmine, neostigmine, etc.) are known. These carbamate-type acetylcholinesterase inhibitors are known to express their inhibitory effect based on the carbamate structure which is characteristic of the molecule (Goodman & Gilman's The PHARMACOLOGICAL BASIS OF THERAPEUTICS, Ninth ed., McGraw-Hill, New York, p. 161-176). However, it is known that, for example, distigmine is insufficient in its clinical efficacy since it contracts the muscle of the urinary bladder with constriction of the muscle of the urethra to increase urethral resistance and consequently make the voiding flow rate worse. In addition, neostigmine has not been used in therapy because of the short duration of its action (Takamichi Hattori and Kosaku Yasuda, " Sinkeiinseiboukou-No-Sindan-To-Chiryō (Diagnosis and Therapy of Neurogenic Bladder)", 2nd Ed., p. 105-106, p. 139, Igaku-Shoin Ltd. Tokyo).

In these compounds, however, there is neither report, suggestion nor disclosure on their effect as prophylactics or therapeutic agents for dysuria (difficulty of urination) or on their effect as excretion improving agents for urinary bladder.

Therefore, it has been a desire to develop prophylactics or therapeutic agents for dysuria, particularly difficulty in urination, which have a high efficiency for urination and high versatility compared with known compounds known to have an effect in improving excretion of the urinary bladder.

There has also been a desire in the pharmaceutical industry to attain crystals that are good in absorbability and are used for an acetylcholine esterase inhibitor, an agent for improving the excretory potency of a urinary bladder, and a therapeutic agent against micturition disorders/dysuria disorders which are stable.

## Summary of the Invention

In view of such current realities, the present inventors searched for highly effective new agents for improving excretion of the urinary bladder with high efficiency of urination, that is, therapeutic agents for dysuria, particularly for difficulty in urination. in ranges of more than about 1/50 of the minimum recommended, clinical dosage to less than the maximum recommended level regarding to the actual case where each of them is administered singly.

## 5 Reference Example 15-1

8-[3-[1-[(3-fluorophenyl)methyl]-4-piperidyl]-1-oxopropyl]-1,2,5,6-tetrahydro-4*H*-pyrrolo[3,2,1-*ij*]quinolin-4-one (Compound of Reference Example 15)

- 10 1) To thionyl chloride (300 mL) was added 3-(1-acetyl-4-piperidyl)propionic acid (88.2 g, 0.443 mol) in small portions under ice cooling. The mixture was stirred at room temperature for 10 minutes, and then thionyl chloride was distilled off at 25°C under reduced pressure. Diethyl ether was added to the residue and then evaporated in vacuo to give a yellow solid. Again, diethyl ether was added, and
- 15 the solid was crushed with a spatula, and ether was evaporated in vacuo to give 3-(1-acetyl-4-piperidyl)propionic acid chloride as crude light yellow powder. This light yellow powder and 1,2,5,6-tetrahydro-4*H*-pyrrolo[3,2,1-*ij*]quinolin-4-one (64.0 g, 0.369

mol) were suspended into 1,2-dichloroethane (200 mL), into which aluminum chloride (162 g, 1.21 mol) was added in small portions at room temperature. The mixture was stirred at room temperature for 12 hours, then added to ice-water, and extracted with ethyl acetate. The extract was washed with saturated brine, dried on anhydrous magnesium sulfate, and evaporated in vacuo to give a light yellow oily material. The oily material was purified by silica gel column chromatography (eluted with ethyl acetate/methanol=9 : 1) and crystallized from ethanol-diethyl ether to give 123.5 g of 8-[3-[(1-acetyl-4-piperidinyl)-1-oxopropyl]-1,2,5,6-tetrahydro-4*H*-pyrrolo[3,2,1-*ij*]quinolin-4-one as colorless crystals having mp. 157-159°C.

After cooling to room temperature, hydrochloric acid was distilled off under reduced pressure, and the resulting residue was made basic (pH >12) with 8*N*-sodium hydroxide aqueous solution and extracted with ethyl acetate. The extract was washed with saturated brine, dried on anhydrous sodium sulfate, evaporated in vacuo, and crystallized from ethyl acetate-diethyl ether to give 103.7 g of 8-[3-[(4-piperidinyl)-1-oxopropyl]-1,2,5,6-tetrahydro-4*H*-pyrrolo[3,2,1-*ij*]quinolin-4-one as colorless crystals having mp. 114-115°C.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ 1.00-1.30 (2H, m), 1.30-1.90 (7H, m), 2.59 (2H, dt, J=12.0, 2.4Hz), 2.72 (2H, t, J=7.6Hz), 2.85-3.15 (5H, m), 3.23 (2H, t, J=8.6Hz), 4.14 (2H, t, J=8.6Hz), 7.68 (1H, s), 7.73 (1H, s).

#### Formulation Example 2

(1)	Compound A	2g
(2)	Lactose	197 g

(3)	Corn starch	50 g
(4)	Magnesium stearate	2 g

According to the same manner as in Formulation Example 1, 2000 tablets of 3 mm in diameter containing 1.0 mg/tablet of Compound A were produced.

#### Formulation Example 3

(1)	Compound A	5.0 mg

#### Experimental Example 1

##### Measurement of acetylcholinesterase-inhibiting action

Acetylcholinesterase-inhibiting action of the compounds disclosed in Reference Examples was measured using acetylcholinesterase of human erythrocyte origin according to the acetylthiocholine method (Ellman method).

Acetylcholinesterase of human erythrocyte origin (Sigma Chemical Co.) was dissolved in distilled water at a concentration of 0.2 IU/mL to give an enzyme authentic sample. To a 96-well microplate was dispensed 20μL of drug solution, 30μL of 80mM Tris-HCl (pH 7.4), 50μL of enzyme authentic sample and 50μL of 5mM 5,5-dithio-bis(2-nitrobenzoic acid)(Sigma Chemical Co.), and the plate was shaken for 10 seconds. Then, 50μL of acetylthiocholine iodide (Sigma Chemical Co.) was added, and the plate was again shaken. Immediately after shaking, increase of extinction at 414 nM

was measured at intervals of 30 seconds for 10 minutes. The enzyme activity was determined according to the following equation.

$$R = 5.74 \times 10^{-7} \times \Delta_A$$

(wherein R indicates an enzyme activity (mol), and  $\Delta_A$  shows increase of extinction at 414 nM)

The experiment was repeated at least 3 times for each compound to obtain 50% inhibitory concentration ( $IC_{50}$ ). Moreover, in the same manner as mentioned above, acetylcholinesterase-inhibiting activity of distigmine was measured. The following table shows the result.

[Table 5]

14 (Hydrochloride)	9.9
15 (Hydrochloride)	4.4
17 (Hydrochloride)	7.8
18 (Hydrochloride)	10.9
Distigmine	723.3

From the above results, it is found that Compounds (I) exhibit a potent acetylcholinesterase-inhibiting action.

#### Experimental Example 2

Potential effect of the compounds disclosed in Reference Examples for rhythmic contraction of urinary bladder in guinea pig

Potential effect of the compounds disclosed in Reference Examples for rhythmic contraction of urinary bladder was examined using Hartley male guinea pigs. Hartley male guinea pigs (SLC) weighing about 300 g were anesthetized with urethane (1.2 g/kg, i.p.), held, and incised at the midline of abdomen to expose the bladder. The urethra was ligated, and a polyethylene tube (PE-50) was inserted into the bladder. The internal pressure of the bladder was measured with a blood pressure amplifier (Nippon Koden), and the data was collected on a personal computer through an A/D converter (MP-30, Biopac Systems). A proper amount of physiological saline was injected into the bladder through a cannula to induce rhythmic contraction of the bladder. To the animals in which occurrence of stable rhythmic contraction was confirmed at a rate of 1 time every 2 minutes to 10 minutes, a solution of the test compound dissolved in distilled water was injected intravenously, and the effect was observed.

The data was manipulated according to the following process.

The area (AUC) that is formed by a curve of the internal pressure of the bladder and a base line was calculated through analytical software (Studentlab pro 2.1.5, Biopac Systems) to evaluate the effect of the test compounds. The curve of the internal pressure is made based on the bladder contraction immediately before administration of the test compound and the first contraction 5 minutes after the administration. From the dose-dependent curve of AUC, the dose at which AUC before drug administration was increased 2 times (AUC200) was calculated to determine potency of contraction-enhancing effect of the test compounds for the muscle of urinary bladder. In addition, the potency of contraction-enhancing effect of stigmine for the muscle of bladder was determined in the same manner as mentioned above.

The following table shows the AUC200 values of each compound.

[Table 6]

From the above results, it is found that Compounds (I) exhibit a high potentiation effect for rhythmic contraction of urinary bladder.

#### Experimental Example 3

### Effect on urination efficiency in guinea pigs

Effect of the compounds of Reference Examples on urination efficiency was examined using Hartley male guinea pigs. Six to ten Hartley male guinea pigs weighing  $346.5 \pm 3.5$  g (SLC) were employed in each treated group. Guinea pigs were anesthetized with urethane, and held, and the bladder was exposed. Two polyethylene tubes (PE-50 and PE-100) were inserted into the bladder. One (PE-50) of the tubes was used in infusion of physiological saline, and the other (PE-100) was used for measurement of the internal pressure of the bladder. Saline was infused continuously at a flow rate of 0.3 mL/min. The infusion was stopped at the time when intermittent urination was confirmed at least 3 times, and the whole saline in bladder was removed. Again, infusion was started, and stopped at the time when a rise of the pressure in bladder was confirmed immediately before urination, and the time required for infusion and the weight of excreted urine were measured. Efficiency of urination was calculated from the following equation.

Efficiency of urination(%) =

$$100 \times \text{Excreted volume (mL)} / \text{Infusion time (min)} \times 0.3 \text{ (mL/min)}$$

Measurement was made at least 2 times before administration of the test compound, and then the test compound was dissolved in distilled water and administered intravenously. As for distigmine, the value was measured 30 minutes after administration, and as for the compounds of Reference Examples, the measurement was made 10 minutes after administration. Effect by administration of solvents was also confirmed.

The average measured value before administration of the test compounds was regarded as the value before administration, and applied to the paired-t test for a significant difference test with the value after the administration. (\*\*  $p < 0.01$ , \*  $p < 0.05$ )

The following table shows the effect on efficiency of urination.

[Table 7]

\*\* p<0.01, \* p<0.05

From the above results, it is found that improvement of urination efficiency by distigmine is poor and it makes the efficiency worse at a high dose, while Compounds (I) improve the efficiency greatly and significantly, and do not make the efficiency worse even at high doses.

#### Experimental Example 4

Effect on the flow rate of urine in guinea pigs

Effect on the flow rate of urine by single or combined use of Compounds of Reference Examples, distigmine, prazosin, and tamsulosin was examined using Hartley male guinea pigs. Four to six Hartley male guinea pigs weighing about 350 g (SLC) were employed in each treated group. Guinea pigs were anesthetized with urethane, and held, and the bladder was exposed. Two polyethylene tubes (PE-100) were inserted into the bladder. One of the tubes was used in infusion of physiological

saline, and the other used for measurement of the internal pressure of the bladder.

Saline was infused continuously at a flow rate of 0.3 mL/min. The infusion was stopped at the time when intermittent urination was confirmed at least 3 times, and the whole saline in bladder was removed. Again, infusion was started, and stopped at the

5 time when a rise of the pressure in bladder was confirmed immediately before urination. Excreted urine was weighed on an electronic force balance (HX-400, A&D). Analogue data of the internal pressure of the bladder and urine weight were input in an AD converter (MP-30, Biopac Systems) and the digital signal was analyzed by means of purpose-made software (Student lab pro 2.1.5, Biopac Systems). Sampling interval of  
10 the date was fixed at 0.1 second, and the value of urine weight was differentiated to determine the flow rate of urine. In order to remove data noise of the excretion volume and flow rate of urine, the data was adapted to a lowcut filter at 0.5Hz.

Measurement was made 2 times before administration of the test compound, and then the test compound was administered intravenously. Again,  
15 measurement was made 10 minutes after administration of the test compound. Effect by administration of solvents was also confirmed as a control experiment.

The average measured value before administration of the test compounds was regarded as the value before administration, and the rate of change of the values from the ante-administration to the post-administration was calculated to compare  
20 between the groups by means of the Dunnet's test.

Effect on the flow rate of urine is summarized in the following table.

From the above result, it is found that improvement of the flow rate of urine by distigmine alone is poor and not enhanced even in combination with an  $\alpha$ -blocker prazosin. On the other hand, it is recognized that Compound (I) per se improves the flow rate of urine, which is further increased considerably in combination with  $\alpha$ -blockers, prazosin and tamsulosin.

From the result of the above-mentioned Experimental Examples 2, 3 and 4, it is found that non-carbamate-type amine compounds showing an acetylcholinesterase-inhibiting action, particularly, Compounds (I) have a potent effect for improving excretory potency of the urinary bladder.

#### Examples Involving Crystals

10

The following Examples are drawn to the embodiments of the present invention involving crystals. The melting points were measured by using a Type-535 melting point apparatus produced by Buechi Company and a MP-500D apparatus manufactured by Yanako Kiki Kaihatsu Kenkyusyo Kabushiki Kaisya. The data on the powder X-ray crystal diffractometry are determined by using Type-RINT1100 (Rigaku Denki Kabushiki Kaisya) using the Cu-K $\alpha$  radiation as the radiation source. Also, in the following Reference Examples and Examples, % indicates the percent by weight, unless otherwise specified.

1) Into thionyl chloride (300 ml) was added 3-(1-acetyl-4-piperidinyl)propionic acid (88.2 g, 0.443 mol) in small portions under ice cooling. After the resulting mixture was stirred at room temperature for 10 minutes, the thionyl chloride was evaporated under reduced pressure at 25°C. The resulting residue was mixed with diethyl ether and was evaporated under reduced pressure to leave a yellow solid residue. An additional diethyl ether was added to the residue and the solid substance was subjected to pulverization by the use of a spatula, followed by evaporation under reduced pressure to obtain a crude product of 3-(1-acetyl-4-piperidinyl)propionyl chloride as a yellow powder. To a suspension of this yellow

powder and 1,2,5,6-tetrahydro-4H-pyrrolo[3,2,1-ij]quinoline-4-one (64.0 g, 0.369 mol) in 1,2-dichloroethane (200 ml) was added aluminum chloride (162 g, 1.21 mol) in small portions at room temperature. After stirring at room temperature for 12 hours, the reaction mixture was poured into ice water and extracted with ethyl acetate. The extract was washed with a saturated aqueous solution of sodium chloride, dried with anhydrous magnesium sulfate, and then evaporated under reduced pressure to remove the solvents, thereby obtaining an oily pale yellow substance. This oily substance was purified by column chromatography on silica gel (eluent: ethyl acetate-methanol = 9 : 1) and crystallization from ethanol and diethyl ether to obtain 123 g of 8-[3-(1-acetyl-4-piperidinyl)-1-oxopropyl]-1,2,5,6-tetrahydro-4H-pyrrolo-[3,2,1-ij]quinolin-4-one, as colorless crystals having the melting point of 157-159°C.

5 To a solution of 8-[3-(4-piperidinyl)-1-oxopropyl]-1,2,5,6-tetrahydro-4H-pyrrolo-[3,2,1-ij]quinolin-4-one (103.7 g, 0.332 mol) in acetonitrile (750 ml), which was obtained in Reference Example 31, were added 3-fluorobenzyl bromide (65.9 g, 0.349 mol) and anhydrous potassium carbonate (80 g) and the resulting solution was stirred at room temperature for 12 hours. The reaction solution was concentrated and poured into a solvent mixture of ethyl acetate (250 ml), tetrahydrofuran (250 ml), and water (200 ml). The organic layer was separated and the aqueous layer was extracted twice with a solvent mixture of ethyl acetate (80 ml) and tetrahydrofuran (50 ml). The combined organic layers were washed with a saturated aqueous solution of sodium chloride (150 ml), dried with anhydrous magnesium sulfate, and then concentrated under reduced pressure to obtain of crude colorless crystals (130.6 g). A half amount of the crude crystals was dissolved into a solvent mixture of ethyl acetate (140 ml), methanol (10 ml), and chloroform (150 ml) with heating at 40°C and purified by column chromatography on silica gel (silica gel: 300 g, eluent: ethyl acetate-methanol = 10 : 1). The same step was repeated to obtain crude crystals in a total amount of 115.4 g. To 115.4 g of the thus-obtained crystals was added ethanol (500 ml) and the resulting mixture was heated to reflux with stirring until it became a homogeneous solution. Ethanol (250 ml) was evaporated under an atmospheric pressure with heating and then the heating was stopped to gradually cool the mixture with stirring for 6 hours. The precipitated crystals were collected by filtration, washed with cold ethanol (250 ml), and then dried at room temperature to obtain 111.3 g of the title compound as colorless crystals having the melting point of 114-117°C. Its X-ray powder diffraction pattern was shown in Figure 1.

absorbance at the wavelength of 414 nm at an interval of 30 seconds was determined for 10 minutes.

$$R = 5.74 \times 10^{-7} \times \Delta_A$$

(wherein R indicates an enzyme activity (mol) and  $\Delta_A$  indicates an increment in absorbance at the wavelength of 414 nm). The experiment was repeated at least three times with each compound to determine the 50% inhibitory concentration ( $IC_{50}$ ). Furthermore, the activity to inhibit the acetylcholine esterase of distigmine was determined in a manner similar to that described in the above method. The results obtained are shown in the following Table.

Sub B9

Compounds	$IC_{50}$ (nM)
Example 1	6.6
Distigmine	651.9

The results described above reveal that the crystals of the present invention possess an excellent activity to inhibit the acetylcholine esterase.

#### Experimental Example 6 Hygroscopicity test

In weighing vessels, 0.3 g of the crystals, which were obtained in Example 1, was weighed and the vessels were stored for the period of 14 days in the desiccators of the relative humidity (RH) of 75% (a saturated aqueous solution of sodium chloride) and of 93% (a saturated aqueous solution of potassium nitrate), with the vessels being opened. After this period, the percent changes in the weight were determined. The results obtained are shown in the following table.

Period of storage (days)	Percent change in weight (%)	
	25°C/75% RH	25°C/93% RH
4	+ 0.11	+ 0.06
7	+ 0.11	+ 0.09
14	+ 0.18	+ 0.15

The results described above reveal that no changes were observed in the weight of the crystals of the present invention, thereby proving a nonhygroscopic property of the crystals.

In addition, the X-ray powder diffraction images of the crystals remained

almost the same before and after their storage, thereby proving a persistence of the crystal form of the crystals.

#### Experimental Example 7

##### Stability test

5 A number of specimens of the crystals obtained in Example 1 were stored under the following conditions and then their changes in the property and the remaining percent were determined.

Storing conditions: 1. 60°C for 3 months (in a brown glass bottle, closed); 2. 45°C, the relative humidity of 75% for 3 months (in a brown glass bottle, closed); 3. 40°C, the  
10 relative humidity of 75% for 3 months (in a brown glass bottle, opened); 4. irradiated with a xenon lamp (60000 lux) for 20 hours (1.2 million lux/hour) (on a Petri dish covered with a polyvinylidene chloride film).

The results obtained are shown in the following table.

	Storing condition	Property	Remaining percent (%)
15	1 (60°C/3 months)	white crystals	99.8
	2 (40°C/75% RH, closed)	white crystals	101.6
	3 (40°C/75% RH, open)	white crystals	100.2
	4 (Xenon lamp/20 hs.)	white crystals	100.1

The results described above reveal that any change in the property and  
20 any decrease in the remaining percent were not observed on the crystals of the present invention, thereby being stable.

In addition, the X-ray powder diffraction images of the crystals remained almost the same before and after their storage, thereby proving persistence of the crystal form of the crystals.

#### Industrial Applicability

The amine compounds used in the present invention show a high effect increasing the contraction potency of the muscle of urinary bladder but no effect of contracting the muscle of urethra. They are, accordingly, useful as agents for improving  
30 excretory potency of the urinary bladder with high efficiency of urination. In addition,

they are useful as prophylactic or therapeutic agents for dysuria, particularly for difficulty of urination.

#### Conclusion

5

The crystals of the present invention possess an excellent action to inhibit acetylcholine esterase and an action to improve the excretory potency of urinary bladder and are low in the toxicity, thereby being useful as drugs. Also, the crystals of the present invention are high in the purity, high in the quality, low in the hygroscopic property, and extremely excellent in the stability without being deteriorated upon a long-term storage under the usual conditions.
